

Sommer cable SC-ELEPHANT ROBUST SPM2440

Specially for the tough everyday stage life Sommer cable have considerably reinforced the jacket stability of the 4.0 mm² SC ELEPHANT series. For when the crowd is going mad and the speakers are turned up full throttle, we do not only face heating minds, but also heating cables. Accordingly maximum performance is required from the cable – in this case a jacket as thick as an elephant skin can help. And a construction which – in addition to the stage-proof ruggedness and impact resistance – makes the cables highly flexible and easy to reel. A nice side effect of the customized jacket stability is the smoother jacket surface; the cable is less susceptible to dirt and thus easier to clean. Optimum conditions for a long life cycle and ideal for stage applications. And if a special wire stranding ensures a loss-free transmission to boot, the SC ELEPHANT ROBUST is a perfect multicore speaker cable.

In particular for the popular speaker multipins (HI-LK008, NL8, NLT8, LKS25) the outer diameters of the SC ELEPHANT ROBUST cable versions were adapted in such a way to enable an easy assembly. Well insulated and numbered wires further simplify the processing.

The SC ELEPHANT ROBUST SPM2440 in the 24 x 4.0 mm² version is used primarily in the field of large-size line arrays or professional PA/sound reinforcement systems at major events. 12 amp channels can be transmitted simultaneously – and almost loss-free – to the PA system.
