Wisycom presents latest App Updates at IBC 2023

Wisycom, a company with expertise in the design and build of sophisticated RF solutions, will showcase the latest version of its Wisycom App at IBC 2023 (Hall 8, Stand C51). Included among the enhancements is added support for some of the brand's latest products, such as the MTP61 bodypack transmitter. The app will now give users the ability to remotely change a channel or transmitter name, as well as

monitor RF levels, battery life and audio levels.

“We look forward to presenting this updated version of the Wisycom App to IBC attendees,” says Massimo Polo, CEO, Wisycom SRL. “With the added support of our latest products, the app provides users with the convenience of managing a greater range of Wisycom equipment directly from their mobile devices.”

The updated app will include timecode (LTC) validity for both the MTP61 and MTP60 bodypack transmitters, along with remote formatting of Micro-SD cards. Added support for the portable RF-over-fiber BFLT1 transmitter and BFLR1 receiver, along with full control, monitoring and firmware updating capabilities for these devices will also now be included.

Available for iOS and Android devices on the Apple App Store and Google Play Store, the Wisycom App allows users to monitor, control and manage Wisycom devices through a Bluetooth 5 long-range connection. With the app, users can change frequency, audio levels, channel/group, TX/RX bandwidth, activate RF power, enable recording, bulk edit device operations, and much more.
