OCA celebrates AES70-2024

The OCA Alliance, the trade association supporting the AES70 standard for Open Control Architecture, announces the public availability of the latest revision of the standard, AES70-2024, which introduces several valuable additions. Along with new classes, the update features new methods, a new specification for using the OCP.1 protocol, and several documentation updates.

Fully backwards compatible with existing implementations, AES70-2024 continues to expand the technical foundations of the growing and evolving OCA ecosystem. Summaries and overviews of the most recent additions to the standard can be found on the OCA Alliance website.

"AES70 is very much a living and evolving standard, and we are grateful to the developers and contributors who continue to support and expand it," says Ethan Wetzell, Marketing Chair for the OCA Alliance. "As media networks expand in relevance and complexity, the ability of AES70 to grow in parallel to offer new components and solutions enhances the value for developers in combining standards and technologies to create holistic solutions."
