

Violectric´s latest headphone amps HPA V202 and HPA V222

Violectric introduces two new entry-level high-end headamps for headphone enthusiasts. Both models offer Violectric´s recognized circuitry created by chief developer Fried Reim. The HPA V202 is meant to drive any pair of headphones with asymmetrical connection regardless of its driver technology and specifications. The HPA V222 offers an additional fully balanced power amplifier and thus drives every headphone on the market. High voltage output, extraordinary power reserve and high damping factor ensure perfect matching even with headphones of exotic parameters. An additional gain stage enables optimum gain adjustment for headphones of either very low or very high efficiency. Both headphone amplifiers are entirely "made in Germany" like all other components created by Violectric.

The German manufacture Violectric enjoys an exceptional reputation for its audiophile sounding headphone amplifiers. Now they are issuing the latest models HPA V202 and HPA V222 to the entry-level segment, offering either balanced or unbalanced amplifier technology.

The Violectric HPA V202 is an affordable headphone amplifier and successor to the bestselling model HPA V200. Its circuitry has been further improved, with 60 volts of operating voltage and an outstanding signal-to-noise-ratio exceeding 100dB (weighted), it shares all the superb specs of the more expensive models. Any headphones can be connected via 6.3 mm (¼ inch) jack or 4.3 mm Pentaconn (asymmetrical). This makes the HPA V202 Violectric´s most affordable option for music-loving listeners using a pair of conventionally wired headphones.

Violectric´s latest headphone amps HPA V202 and HPA V222

The HPA V222 offers a fully balanced output circuitry with four independent power output stages. This allows it to drive balanced wired headphones ensuring a perfect separation of each part of the signal. To facilitate this, it has both a balanced 4-pin Canon/XLR and a 4.3 mm Pentaconn in its front panel. An additional 6.3 mm ($\frac{1}{4}$ inch) output drives conventional headphones in asymmetrical way.

In their input stages, both HPA V202 and HPA V222 accept either balanced signals being processed via XLR input or unbalanced ones via RCA. An input selector enables to choose one of these inputs, so that both headphone amplifiers can also be used as a simple preamplifier. They do this in a particularly audiophile way, as the attenuation is handled by a premium-quality RK27 potentiometer. An aluminium knob on the front panel gives the user user full control of the volume.

With gain steps between -18dB and +18dB, the popular pre-gain circuit allows for further adjustment to the specific headphones. This ensures an optimal dynamic range of both the volume control and the amplifier stages even for headphones of particularly high or low efficiency.

With high output voltage, extremely low noise floor and high damping factor, the power amplifier ensures optimal adaptation even with exotic parameters of the connected headphones.

All Violectric devices are developed and assembled in-house in our manufacture at Lake Constance in the south of Germany. The comparably affordable models HPA V202 and HPA V222 make no exception to this. Both meet the highest standards without compromising and have to pass an intensive test procedure before being shipped. Precise craftsmanship and the best electronic parts on the market give every single Violectric not just an outstanding feeling of quality, but also guarantee an exceptionally long lifespan of each unit.

The Violectric HPA V202 and HPA V222 are marketed exclusively by cma audio and will be available as from late October 2022.
